

In this phase, you can sell carbon credits. This is how carbon credits work:

Your carbon credits are calculated based on your emissions and a „baseline“. The baseline increases over the years. This table shows the baseline in tons of CO₂ per year for 25 years. You can sell carbon credits every year.

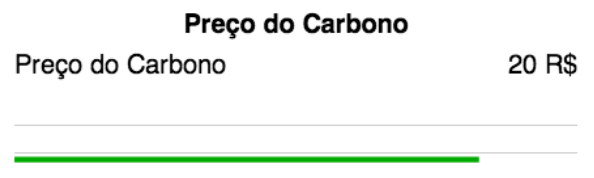

Year	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026
CO ₂	5'000	5'100	5'200	5'400	5'600	5'850	6'150	6'500	6'900	7'350	7'850	8'400

2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039
9'000	9'600	10'300	11'000	11'800	12'600	13'500	14'400	15'400	16'400	17'450	18'550	19'700

If you deforest less than the baseline in one year, you receive and sell carbon credits. The number of credits is calculated as the difference between the baseline and your real deforestation. The green line in the graph shows how much you sell. If you deforest nothing, this is what the graph looks like.

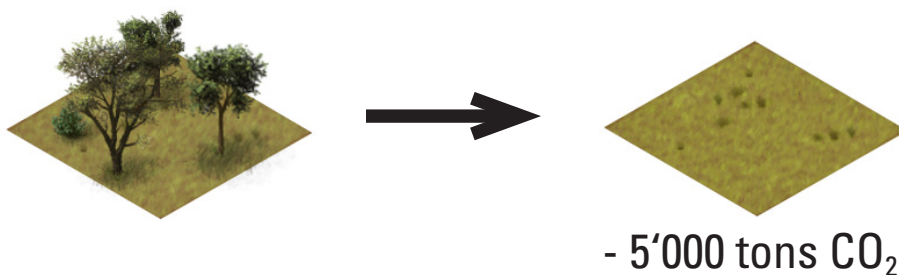

You receive a fixed price of 20 R\$ per ton of CO₂ every year.

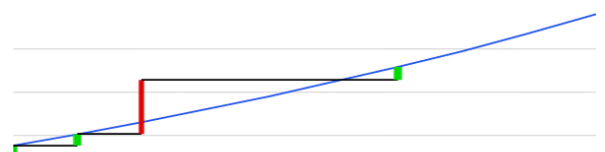

You will see the value of selling carbon in your financial statistics every year.

Subsídios	+ 100,000 R\$
Redução de Emissões	5000 t CO ₂
Preço do Carbono	20 \$R

Deforesting one cells costs 5'000 tons of CO₂.

If you deforest more than the baseline in one year, you do not receive any more carbon credits till the baseline „catches up“ with you emissions. The red line shows your emissions from deforestation.

After 25 years, the payments for carbon come to an end. The phase lasts till 2061.
